Regression Line

Fitting a line between X and Y

Fitting a line

which is the best line?

How to find the
“best” fitting line?

Line formula

$$y = mx + b$$

Line formula

how much the y-value changes when
the x-value increases by 1 unit

$$y = \overset{\text{slope}}{m}x + \underset{\text{intercept}}{b}$$

y-value of the point of interception
of the line and the y-axis

Types of slopes

Line formula

Line formula

Line formula

Regression Line formula

$$\textit{predicted } y = mx + b$$

Reminder: Associated with each increase of one **SD** in **x** there is an increase of only **r SDs** in **y**, on the average

Regression Method

Regression Line formula

$$\mathbf{m} = r \left[\frac{SDy}{SDx} \right]$$

$$\mathbf{b} = \text{mean}(y) - r \left[\frac{SDy}{SDx} \right] \text{mean}(x)$$

Finding the regression line

Group of men with:

X: avg height = **70** inches, SD = **3** inches

Y: avg weight = **180** pounds, SD = **45** pounds

- $r = 0.40$

$$m = 0.40 \left[\frac{45}{3} \right] = 6$$

Finding the regression line

Group of men with:

X: avg height = **70** inches, SD = **3** inches

Y: avg weight = **180** pounds, SD = **45** pounds

- $r = 0.40$

$$b = 180 - 0.4 \left[\frac{45}{3} \right] 70 = -240$$

Finding the regression line

Group of men with:

X: avg height = **70** inches, SD = **3** inches

Y: avg weight = **180** pounds, SD = **45** pounds

- $r = 0.40$

$$\text{predicted } y = 6x - 240$$

Finding the regression line

Predict weight for a man with height 60 inches

$$\textit{predicted } y = 6x - 240$$

$$\textit{pred } y = 6 (60) - 240 = 120 \text{ pounds}$$

Finding the regression line

Predict weight for a man with height 78 inches

$$\textit{predicted } y = 6x - 240$$

$$\textit{pred } y = 6 (78) - 240 = 228 \text{ pounds}$$

Finding the regression line

Predict weight for a man with height 0 inches

$$\textit{predicted } y = 6x - 240$$

$$\textit{pred } y = 6 (0) - 240 = - 240 \text{ pounds}$$

Least Squares Criterion

We need a
mathematical criterion
to find the “best” line

what do we mean
by “best” line?

What criterion to fit a line?

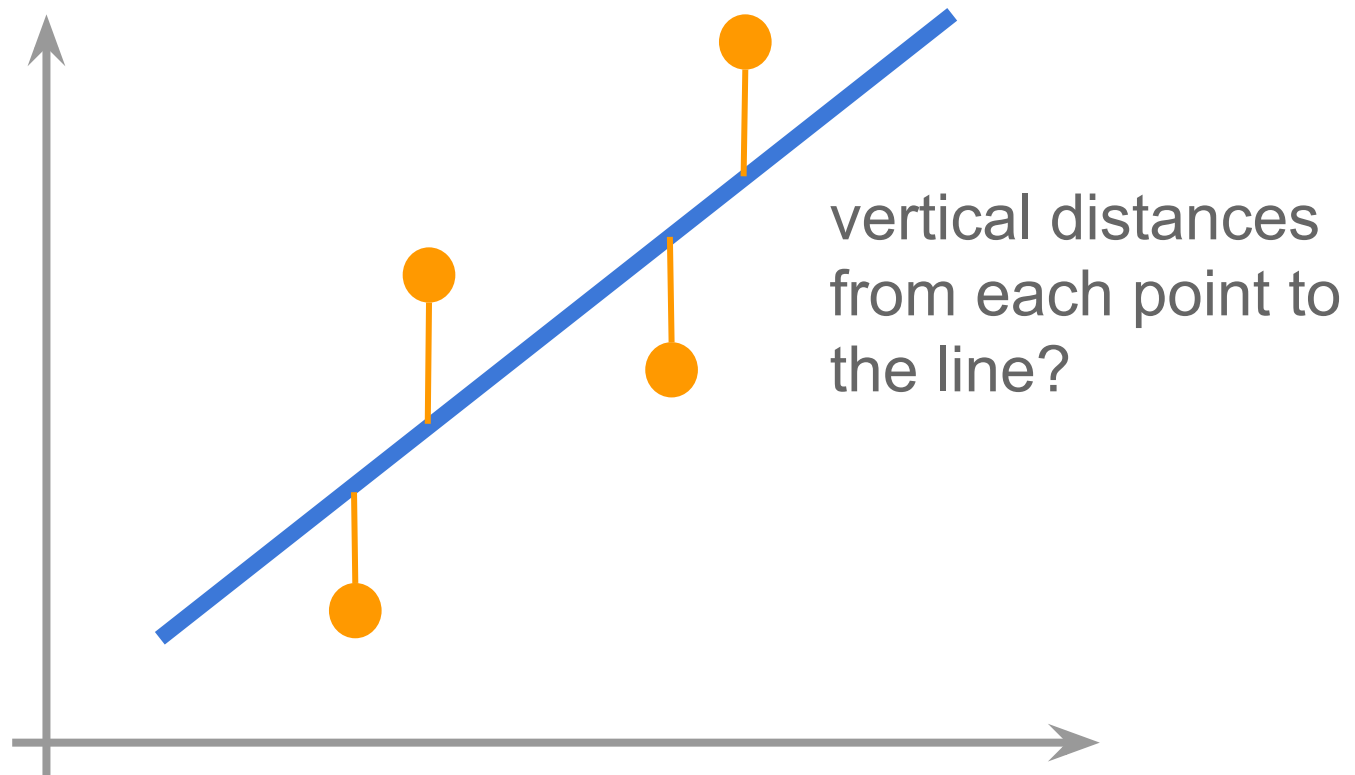

What criterion to fit a line?

What criterion to fit a line?

What criterion to fit a line?

What criterion to fit a line?

What minimization criterion?

minimize $\sum e_i$?

sum of vertical
distances?

What minimization criterion?

minimize $\sum e_i$?

sum of vertical
distances?

minimize $\sum |e_i|$?

sum of absolute
values of vertical
distances?

What minimization criterion?

minimize $\sum e_i$?

sum of vertical
distances?

minimize $\sum |e_i|$?

sum of absolute
values of vertical
distances?

minimize $\sum e_i^2$?

sum of squares of
vertical distances?

least squares criterion

Line A: $y = 0.50 + 1.25x$

Line B: $y = -0.25 + 1.50x$

What line fits the data points the best?

Line A: $y = 0.50 + 1.25x$

x	y	\hat{y}	e	e^2
1	1	1.75	-0.75	0.5625
1	2	1.75	0.25	0.0625
2	2	3.00	-1.00	1.0000
4	6	5.50	0.50	0.2500
				1.8750

(a)

Line B: $y = -0.25 + 1.50x$

x	y	\hat{y}	e	e^2
1	1	1.25	-0.25	0.0625
1	2	1.25	0.75	0.5625
2	2	2.75	-0.75	0.5625
4	6	5.75	0.25	0.0625
				1.2500

(b)

minimum sum of squared distances

Least Squares Criterion

The sum of the squares of the vertical distances from the points to the line is made as small as possible.

Alternative Formula

Alternative formula to
find **b** and **m**

$$y = mx + b$$

slope intercept

Intercept and slope formulas

$$m = \frac{n \sum x_i y_i - (\sum x_i) (\sum y_i)}{n \sum x_i^2 - (\sum x_i)^2}$$

$$b = \bar{y} - b\bar{x}$$

Example

X = size of caribou population (100s)

Y = size of wolf population

Example

caribou	wolves			
x	y	x^2	y^2	xy
30	66	900	4356	1980
34	79	1156	6241	2686
27	70	729	4900	1890
25	60	625	3600	1500
17	48	289	2304	816
23	55	529	3025	1265
20	60	400	3600	1200
$\Sigma x = 176$	$\Sigma y = 438$	$\Sigma x^2 = 4628$	$\Sigma y^2 = 28,026$	$\Sigma xy = 11,337$

$$\bar{x} = 25.14 \quad \bar{y} = 62.57$$

Slope

$$m = \frac{n\sum xy - (\sum x)(\sum y)}{n\sum x^2 - (\sum x)^2}$$

$$m = \frac{7(11,337) - (176)(438)}{7(4628) - (176)^2} = 1.60$$

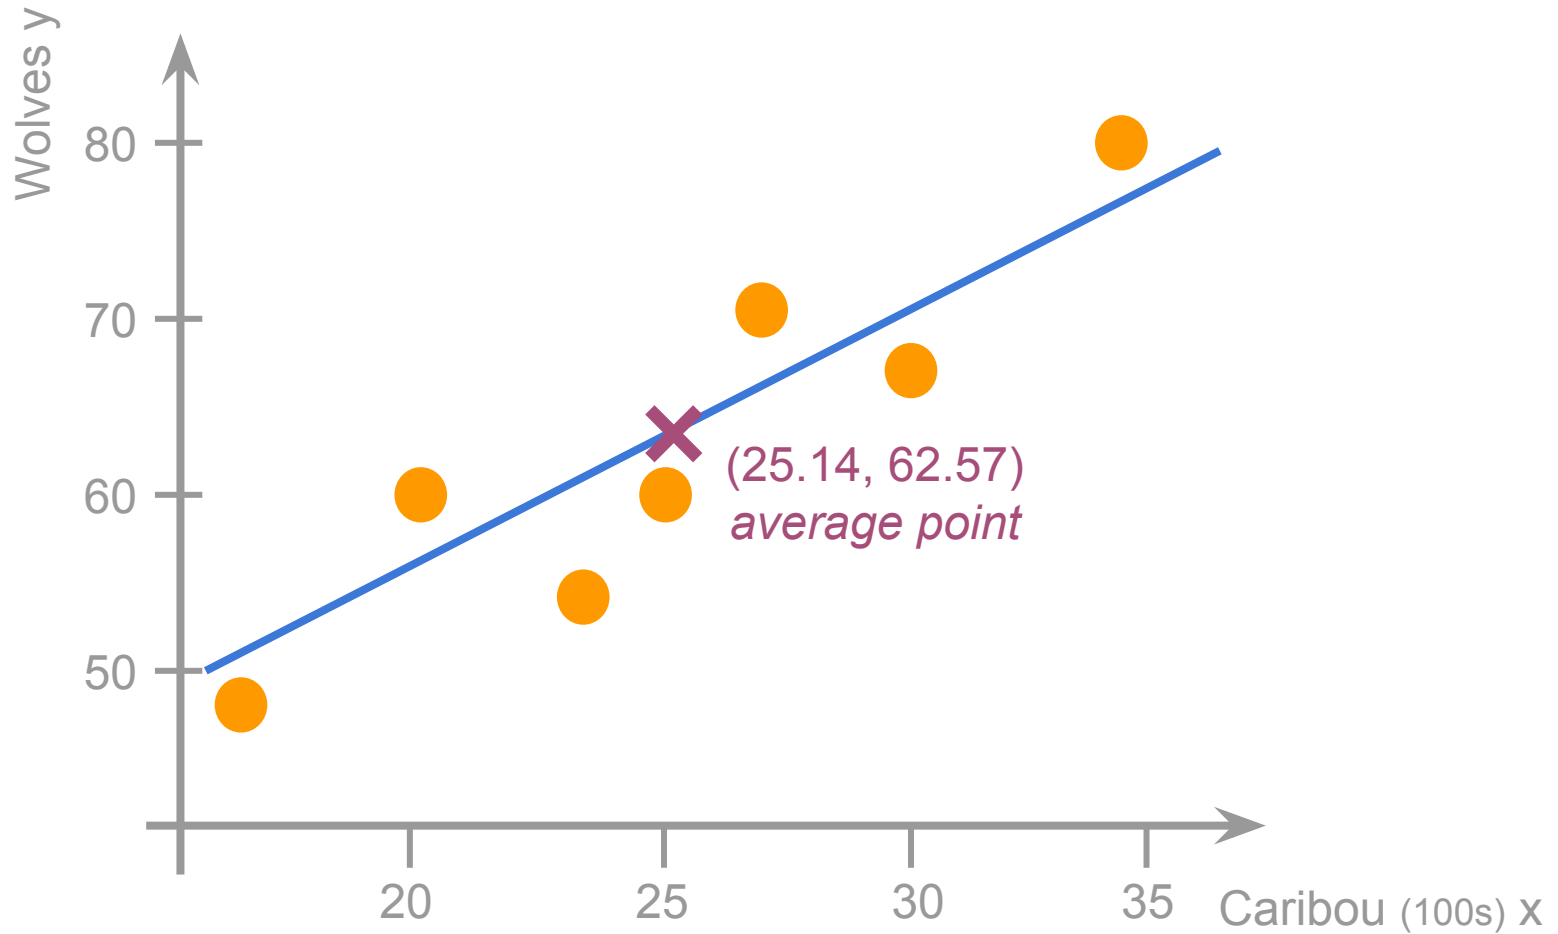

Intercept

$$b = \bar{y} - m\bar{x}$$

$$b = 62.57 - 1.60 (25.14) = 22.35$$

$$\hat{y} = mx + b = 1.60x + 22.35$$

Regression line

Regression for prediction

We can use a regression model to make predictions

Prediction: Obtaining a value of **y** for a “new” value of **x**

Predicting y values

caribou	wolves
x	y
30	66
34	79
27	70
25	60
17	48
23	55
20	60
21	?

Caribou & Wolves example

For $x = 21$, what is the predicted \hat{y} ?

$$\hat{y} = 22.35 + 1.60 x$$

$$\hat{y} = 22.35 + 1.60 (21) = 55.95$$

Predicted values

caribou	wolves
x	y
30	66
34	79
27	70
25	60
17	48
23	55
20	60
21	56
